

Thank you for installing Thupri Cafe!

Hello, and thank you for installing, we appreciate it!

If you haven't installed yet, do it so by dragging and dropping it to the "Documents" folder. Not "Applications" because this is a Python script.

How to run

First, make sure you have Python installed. Check by running this in your terminal.

```
› python3
```

If it shows something, you're good. If not check if you have the old version (not Python3) by running this:

```
› python
```

If it shows something, you must upgrade Python to Python3.

If it still doesn't show something, you don't have Python installed. Do so by running this:

```
› brew install python pyqt pytz
```

Now, if you had Python3 installed already, you need to install the following dependencies by running these commands:

```
› brew install pyqt  
› pip3 install pytz --break-system-packages
```

Now you need to go to the place where "Thupri Café" is installed, which is in this directory:

~/Documents/Thupri Café

After that, you need to run this terminal command:

```
› python3 imlovinit.py
```

Thanks again for installing Thupri Café, and make sure, that...

you're lovin' it
